## Eessõna

Käesolev raamat on statistiline kokku-võte Eesti ravimikasutamise andmetest aastatel 2006-2007. Tulemused põhinevad ravimate hulgimüütjate poolt esitatud aruannetel, mis kajastavad ravimate müüki hulgimüütjatelt üld- ja haiglaap-teekidele ning teistele asutustele.

Eesti ravimikasutamise andmete võr-reldavuse tagamiseks teiste riikidega on tulemused esitatud anatoomilis-terapeutilis-keemilise (ATC) klassifi-katsiooni alusel, defineeritud päeva-dooside arvuna tuhande inimese kohta ööpäevas (DPD/1000/ööpäevas). Defi-neeritud päevadoos (DPD) on Maailma Terviseorganisatsiooni poolt välja töötatud kokkuleppeline suurus enamiku kasutusel olevate ravimate jaoks. DPD ei tähista ravimi tegelikku või soovita-vat annust, sest ravimil võib olla mitu näidustust ning manustatud annused sellele vastavalt ka erineda. Definit-siooni kohaselt on defineeritud päeva-doos (DPD) ravimi tavaline ööpäevane annus täiskasvanul vastavalt peamisele kasutamisenäidustusele.

Defineeritud päevadoos tuhande inime-se kohta ööpäevas (DPD/1000/ööpäev) näitab ravimi kasutamise intensiivsust populatsioonis – mitu inimest tuhandest võis iga päev kasutada seda ravi-mit tavalises annuses. Näiteks suurus 10 DPD/1000/ööpäevas viitab sellele, et keskmiselt 10 inimest tuhandest, seega 1% elanikkonnast kasutab antud ravimit igapäevaselt.

Andmete põhjal järelduste tegemisel tuleks kindlasti arvestada sellega, et tegemist on hulgimüügi andmetega ning kõik müüdud ravimid ei jõudnud tar-bijani, ja ka osa apteegist koju viitud

## Foreword

This book is a statistical summary of the Estonian drug consumption data in 2006-2007. The figures included in the book represent sales from the wholesalers to general and hospital pharmacies and to other institutions.

In order to provide better possibilities for sharing experiences and making comparisons, the Anatomical-Therapeutic-Chemical (ATC) classification of medicines and the Defined Daily Dose (DDD) methodology recommended by the World Health Organization is used. The DDD is the assumed average dose per day for the drug used in its main indication in adults. It is a technical unit of measurement and does not always correspond to the clinical dose actually used.

The national consumption statistics are expressed as the number of DDDs per 1000 inhabitants per day (DDD/1000/day). Drug consumption expressed in this way may provide a rough estimate of the proportion of the population within a defined area treated daily with certain drugs. An estimated drug consumption of 10 DDD/1000 inhabitants/day corresponds to a daily use of this drug by 1% of the population.

When interpreting the figures provided by the wholesalers it is worth noting that some drugs may still be unused, either in pharmacies or in patient homes. The DDD figure is generally calculated in

ravimitest võis jäada kasutamata. Samuti on oluline meeles pidada, et mõne ravimi tarvitamine on piiratud vastavate ea- või soogruppidega. Näiteks suukaudsete rasestumisvastaste preparaatiid koguarv on jagatud fertiilses eas (15-45 aastat) olevate naiste arvuga. Samas ei ole eagruppe siin raamatus kõikjal kasutatud, näiteks *digoxiini* kasutavad valdavalt vanemaealised, kuid arvutustes on kasutatud kogu rahvastiku andmeid.

Lisaks ravimite kasutamise andmetele annab raamat ülevaate ravimituru jaotumisest põhiliste farmakoloogiliste rühmade vahel. Kokkuvõtttest on välja jätetud kasvajatevastaste ravimite (v.a. hormoonide antagonistid), üld- ja lokaalanesteetikumide, silmaravimite (v.a. glaukoomi ravimid) ja kõigi dermatoloogiliste ravimite kasutamise andmed, millele on keskmise päevaodosi (DPD) rakendamine ebaotstarbekas. Põhjuseks on ravimite annustamise individuaalsus (dermatoloogilised ravimid), ravimite ühekordne kasutamine (anesteetikumid) või ravimisel väga erinevate manustamisskeemide kasutamine (kasvajatevastased ravimid).

Tähelepanu tuleks pöörata ka asjaolule, et käesolev raamat kajastab ainult ravimite kasutamise andmeid. Aine määratlemine ravimiks või mitteravimiks toimub vastavalt ravimiseadusele ning olenevalt preparaadi omadustest võib sama aine sisalduda nii ravimis kui mitteravimis. Oluline on see aspekt eelkõige vitamiinide (A11) ja mineraalainete (A12) rühma juures, kus ravimiks liigitatud preparaatiid kasutus ei peegelda vitamiinide/mineraalainete täit kasutust, kuna paljud vitamiine või mineraalaineid sisaldavad preparaadiid ei ole ravimid.

relation to the total population, although the drug use may be concentrated in certain age groups or particular sex. For example in calculation of the use of oral contraceptives the number of females at the age of 15-45 years is used instead of the total population. On the other hand age groups are not always used in this book. For example, elderly people mainly use *digoxin*, but instead of the age groups the total population is used.

In addition to the drug consumption data the current book provides an overview of the distribution of medicine sales between main ATC groups. For several important drug groups (antineoplastic drugs, anesthetics, dermatological and ophthalmological preparations) the DDD is not applicable, so those drugs lay beyond the scope of this study. The DDD of a drug can be very difficult to establish, as the drug dose depends on indications, individuals and therapeutic practice. The premises on which the data are based should always be considered when interpreting and evaluating the data.

The current book only gives the consumption data of medicines. The classification of substances as a medicine or non-medicine is based on the medicinal products act. One substance may occur in a medicine as well as in a non-medicine, depending on the characteristics of the preparation. This is relevant mainly when interpreting the consumption data of vitamins (A11) and mineral supplements (A12) thus the preparations classified as medicines do not represent the whole consumption of vitamins or mineral supplements as some preparations are classified as non-medicines.

## Ülevaade ravimiturust

Eesti ravimituru maht 2007. aastal hulgimüügi hindades oli 2666 miljonit Eesti krooni (170 miljonit EUR), mis on 17,9% suurem võrreldes 2006. aastaga.

**Tabel 1. Ravimituru maht hulgimüügi hindades 2003-2007.**

## Overview of the medicinal products market

In 2007, sales of medicines in Estonia at wholesale prices totalled 2666 million Estonian kroons (170 million EUR), mis on 17,9% suurem võrreldes 2006. aastaga.

6 suurima turuosaga hulgimüütjat kata-  
vad enam kui 90% kogu ravimiturust.

6 leading wholesalers cover more than  
90% of the medicinal products market.

**Tabel 3. Enim ravimeid müünud hulgimüütjad ja nende osakaal ravimiturul (%)**  
*Table 3. The leading wholesalers in the medicinal products market and their market share (%).*

Hulgimüütja	2003	2004	2005	2006	2007
Tamro Eesti OÜ	30,10%	29,90%	30,50%	30,20%	31,00%
Magnum Medical OÜ	47,80%	42,40%	25,90%	26,70%	27,19%
Apteekide Koostöö Hulgimüük OÜ		2,50%	15,00%	12,90%	12,37%
Nordic Pharma OÜ	3,10%	4,70%	10,00%	11,60%	11,04%

## Ravimite kasutamise andmed

Järgnevatel lehekülgedel on ravimite kasutamise andmed esitatud defineeritud päevadooside arvuna tuhande inimese kohta ööpäevas (DPD/1000/ööpäevas) aastatel 2006-2007. Joonistel on kasutatud vastavaid andmeid aastatel 2003-2007.

Arvutused põhinevad hulgimüütjatelt üldapteekidele, haiglaapteekidele ja teistele asutustele müüdud ravimite kogusel, ravimi defineeritud päevadoosil ja Eesti rahvaarvul iga aasta 1. jaanuari seisuga, mis on ära toodud alljärgnevas tabelis.

Tabel 7. Arvutustes kasutatud rahvaarv.  
Table 7. Population figures used in calculations.

Aasta Year	Rahvastik 1. jaanuari seisuga Population of 1 <sup>st</sup> of January	Naiste arv vanuses 15-45 aastat Number of females at age of 15-45 years
2003	1 360 000	300 000
2004	1 350 000	300 000
2005	1 350 000	300 000
2006	1 340 000	290 000
2007	1 340 000	290 000

Naiste arvu vanuses 15-45 aastat on kasutatud DPD/1000/ööpäevas arvutamiseks järgmiste ATC rühmade korral: G02B ja G03A. Teiste rühmade korral on kasutatud kogu rahvastiku andmeid.

The number of females at the age of 15-45 is used to calculate the DDD/1000inh/day for the following ATC groups: G02B and G03A. In other ATC groups the number of total population is used.

Järgnev näide kirjeldab DPD/1000/ööpäevas arvutamist simvastatiini kasutusandmete põhjal.

The following example describes the calculation of DDD/1000 inhabitants/day based on simvastatin consumption data.

Defineeritud päevadoos simvastatiinile DDD of simvastatin	0,015 g
Müüdud toimeaine kogus aastas Sold quantity of active substance per year	67 426,5 g
Rahvastik Population	1 340 000
DPD/1000/ööpäevas DDD/1000 inhabitants/day	$\frac{67426,5 * 1000}{0,015 * 1340000 * 365} = 9,19$

Saadud tulemus 9,19 DPD/1000/ööpäevas viitab sellele, et ligikaudu 9 inimest tuhandest võis aasta jooksul iga päev kasutada simvastatiini tavalises annuses (0,015 g).

The figure of 9,19 DDD/1000/day indicates how many people (in this case 9,19) per 1000 inhabitants may in theory have received daily the standard dose (0,015 g) of simvastatin.

## Drug Consumption Data

On the following pages drug consumption is expressed as a number of DDDs per 1000 inhabitants per day (DDD/1000 inhabitants/day) for the period 2006 to 2007. On the charts corresponding data from 2003 to 2007 is used.

The calculations are based on the volume of sales to general and hospital pharmacies and to other institutions by wholesalers, on the defined daily dose per day for each drug and on the population figure in Estonia as of the 1st of January for each year which is brought out in the table below.

Lisaks üldistele ravimikasutamise muutustele on aastate jooksul toimunud mitmeid muutusi ATC-klassifikatsioonis (toimeained on liikunud ühest rühmast teise, lisandunud on uusi toimeaineid) ja ravimite päevadoosides. Ülevaate ATC-klassifikatsioonis toimunud muutustest ja kogu päevadoose puudutava info leiate WHO kodulehelt <http://www.whocc.no/atcddd/>.

Toimeainete ja farmakoloogiliste rühmade nimetused on esitatud ingliskeelsetena, et hõlbustada Eesti andmete võrdlust teiste maadega. Lisaks toimeaine nimetusele on sulgudes esitatud defineeritud päevadoosi väärtsus. Kui päevadooside väärtsus ühel toimeainel vastavalt manustamisviisidele oli rohkem kui 3, siis on erinevate väärstuste asemel sulgudes "different DDDs".

Kui mõne toimeaine kasutamine oli väiksem kui 0,01 DPD/1000/ööpäevas, siis on see tabelis märgitud <0,01. Kui toimeainet pole mingil aastal Eestis kasutatud, on vastav lahter tühi.

Protsentväärtsus DPD väärstuste järel tabelis näitab konkreetse ATC rühma või toimeaine kasutuse muutust 2007. aastal võrrelduna 2006. aastaga.

In addition to general changes in drug consumption in time there have been many changes related to the updates in ATC-classification and alterations in DDD assignment. The detailed information about the changes in ATC-classification and all about DDD values are available on the following website  
<http://www.whocc.no/atcddd/>.

The English version of ATC classification is used in order to facilitate comparisons with other countries. The values of the Defined Daily Doses are represented in the parenthesis. If there were more than 3 different DDD-s, instead of the real values the "different DDDs" is written.

When the DDD/1000 inhabitants/day value was less than 0,01, it is stated as <0,01. When certain substances were not consumed in Estonia during a year the cell is empty.

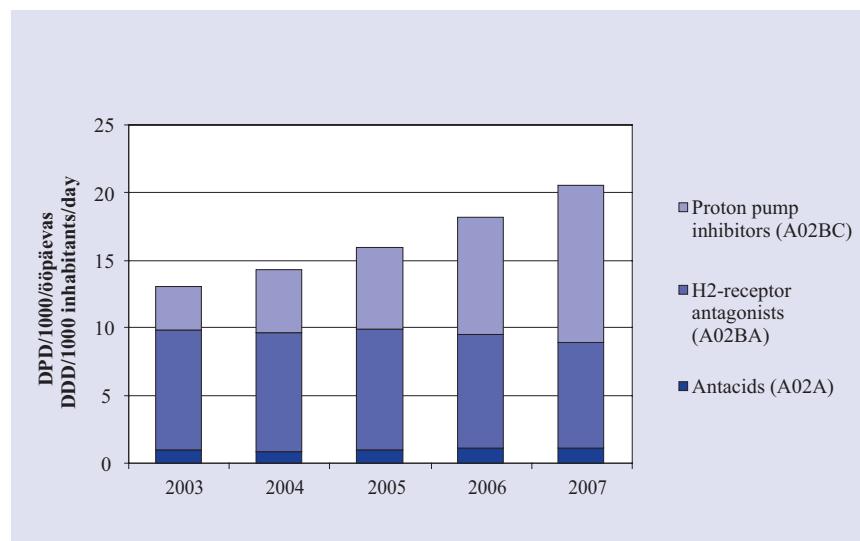

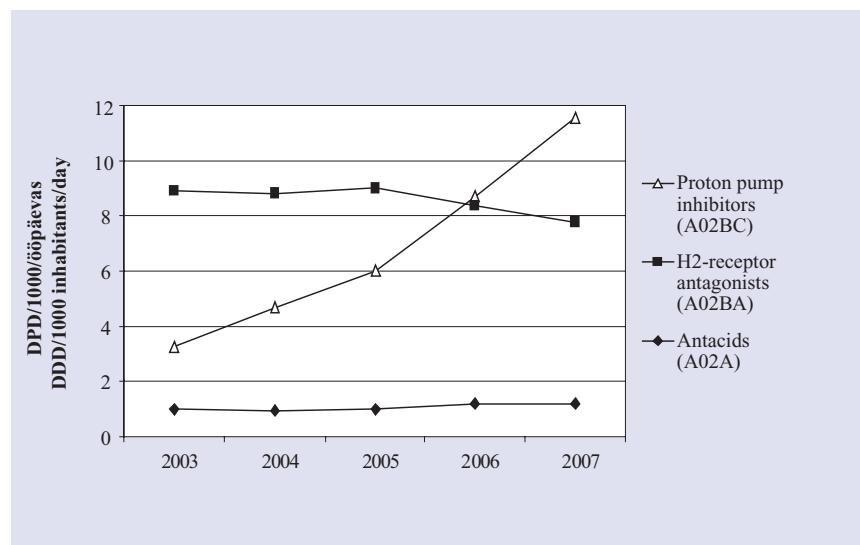

Percentage following the DDD values indicates the change in ATC group or active substance consumption in 2007 compared to 2006.

**Tabel 8. Ühikute ja manustamisviiside esitamisel kasutatud lühendid.**
